

AgriSarathi AI Advisor Integration (Week 7)

Intern ID: BhumikaBahuguna | Week 7

1. User Input Screen

Description: The AI Agronomist Advisor screen allows authenticated farmers to select one of their registered crops to use as active context. The user inputs their prompt (e.g. asking about nitrogen management) in the inquiry box.

AgriSarathi AI Agronomist Advice - General Advisory

Based on your farming telemetry query regarding **general farming**, here is your professional guidance:

General Recommendations

1. **Soil Health**: Perform a basic soil test to check NPK ratios and pH levels. Maintaining soil pH between 6.0 and 7.5 is ideal for most agricultural cycles.

2. **Crop Rotation**: To prevent pest build-up and maintain nitrogen balance, rotate nightshade categories (vegetables like potatoes/tomatoes) with legumes (beans/peas).

Water Optimization

Implement **Drip Irrigation** systems where applicable to save up to 40% water compared to flood irrigation, reducing weed growth significantly.

AgriSarathi AI Advisor answers are generated automatically using active telemetry context. Please cross-reference recommendations locally.
